

To support working with different env/profiles we need create one configuration per one env by following the naming convention as applicationname-profile.properties|yml

```
application.yml
spring:
   application:
    name: distributor-network
   profiles:
    active: dev

bootstrap.yml
------spring:
   config:
   import:
   - "configserver:http://localhost:9099/"
```
