

1. we need to pour lot of time in designing and architecting the system inorder to implement security
2. we need to write lot of code and complexity involved in implementing the security is very high and takes huge amount of time
3. proper testing needs to be done inorder to ensure there are no security breaches in allowing the access to the application. We need specialized security test engineers who can understand the security aspects/technics inorder to test and certify the application from security standpoint of view. this requires huge amount of time in testing and cost of certifying the application is very high
