+---------------------+                                    +---------------------+
```

The Third-Party application is an in-house or trusted application that can gain access directlty to the resource and there is no resource owner applicable.
In such case we dont need to use Authorization Code flow rather we can use Password Grant

The Third-Party application can acquire access token directly by sending a request to Authorization Server by authenticating himself with username/password of the Resource Owner.
